

Contact Center Knowledge Base

Fictional telecom operator · Version 3.2 · Demo document created for the Jeen AI home assignment. Not a real company document; all procedures, codes and offers are invented.

1. Purpose and scope

This knowledge base supports first-line representatives in the contact center of a fictional national telecom operator. It covers the five most common request categories: Login Issue, Account Access, Technical Support, Billing and Subscription. Each article lists the checks to perform, the steps to guide the customer through, and the rule for escalating to a Tier-2 team.

Representatives must always verify the customer's identity before discussing account details, and must never promise refunds, credits or dates that are not stated in an article.

2. KB-112 Personal area: login failure

Symptoms: the customer cannot log in to the personal area on the website or in the mobile app. Typical messages are "incorrect password", "user not found" or a reset code that never arrives.

Steps: first verify that the mobile number on the account is correct and active. Then send a password reset SMS from the CRM. Ask the customer to clear the app cache, update the app to the latest version, or try a different browser. Most login issues are resolved at this stage.

Escalation rule: after two failed resets, or if the account status in the CRM shows "locked", escalate the case to the Tier-2 Identity & Access team. Target response time: 4 hours. Record every reset attempt in the ticket so Tier-2 does not repeat it.

3. KB-118 Account access: locked or suspended accounts

An account is locked automatically after five failed login attempts within 15 minutes, or manually after a fraud alert. A locked account cannot be unlocked by first-line representatives.

If the lock was triggered by failed attempts, the account unlocks automatically after 30 minutes; advise the customer to wait and then use the reset flow. If the lock was triggered by a fraud alert, do not discuss the reason with the customer: open a ticket with priority High and escalate to the Security team.

A suspended account is different from a locked one. Suspension follows unpaid bills; refer the customer to the Billing section and the payment arrangement procedure.

4. KB-201 Area outages: check before troubleshooting

Before any home troubleshooting or technician visit for a connectivity problem (internet, phone line or TV), check the outage map for the customer's city and street. A large share of "no service" calls during an outage come from customers in the affected area.

If an active outage covers the customer's address, do not run router resets and do not schedule a technician. Give the customer the estimated fix time shown on the outage record, offer an SMS update when service is restored, and tag the ticket with the outage ID.

If no outage is recorded but three or more customers on the same street report the same problem within an hour, report a suspected outage to the Network Operations Center.

5. KB-214 Internet disconnections and slow speed

Ask the customer whether the problem affects all devices or a single device, and whether the router lights are normal. A red or blinking internet light usually indicates a line problem; normal lights with one slow device usually indicate a Wi-Fi or device problem.

Guide the customer through a router restart: unplug the power for 30 seconds, reconnect, and wait three minutes. Run a line test from the CRM. If the line test fails, or the customer reports repeated disconnections within 30 days of a previous fix, schedule a technician visit and mark the ticket as a repeat issue.

For slow speed on Wi-Fi only, recommend placing the router in a central, elevated location and connecting heavy-use devices by cable.

6. KB-305 Billing: double charge and refund requests

When a customer reports being charged twice, open the last two invoices and the payment history. A duplicate charge appears as two identical amounts on the same billing date.

If a duplicate charge is confirmed, open a Billing ticket with priority Medium and attach both transaction references. The refund is issued by the Billing department to the original payment method within two billing cycles. Representatives may tell the customer that the case is being handled, but must not promise a specific refund date.

If the charge is not a duplicate (for example, a prorated charge after a plan change), explain the invoice line by line and offer to send the explanation by email.

7. KB-330 Subscription changes and cancellation

Plan upgrades take effect immediately; downgrades take effect at the start of the next billing cycle. Explain any prorated amounts before confirming a change.

When a customer asks to cancel or disconnect a service, record the stated reason in the CRM before processing the request. Customers who mention moving to a competitor, repeated service failures or high bills are flagged as a retention opportunity; follow section 8 before completing the cancellation.

8. Retention offers catalogue

Representatives may present at most one offer per call, exactly as written below, and only when the customer meets the eligibility conditions. Offers that require approval must be approved by a team lead in the CRM before they are presented.

RET-02 Speed upgrade: a free speed upgrade for six months. Eligibility: fiber customers with two or more contacts in the last 30 days. Approval: team lead.

RET-07 Service-failure goodwill offer: one month of internet service at no charge. Eligibility: customer for more than five years, with an open service-failure ticket older than 24 hours. Approval: the representative may offer it directly; it is logged in the CRM automatically.

RET-11 Loyalty review: a call back from the retention team within one business day to review the customer's plan. Eligibility: any customer who explicitly asks to cancel. Approval: none.

9. Escalation and SLA matrix

Every ticket receives an urgency level. CRITICAL: the customer has no access to the service or the account, and the ticket priority is High or the problem has lasted more than 24 hours. HIGH: priority High, or the same category reopened within 30 days, or a retention risk. NORMAL: all other tickets.

Target first response by Tier-2: CRITICAL within 4 hours, HIGH within 8 business hours, NORMAL within 3 business days. When escalating, always include a summary of what was already checked, the customer's preferred contact channel and any retention flag.

Urgency	Condition	Tier-2 first response
CRITICAL	No access + priority High or > 24h	4 hours
HIGH	High priority, reopened, or retention risk	8 business hours
NORMAL	All other tickets	3 business days
